## IN THE CLAIMS

Please amend the claims as follows. This listing of claims replaces all prior versions.

- 1. (Currently amended) A method of identifying a human subject having an increased sensitivity to warfarin, wherein a therapeutic dose of warfarin for the subject is lower than a therapeutic dose of warfarin for a normal subject, comprising detecting in the subject the presence of a single nucleotide polymorphism in the VKOR gene, wherein the single nucleotide polymorphism is correlated with increased sensitivity to warfarin, thereby identifying the subject having increased sensitivity to warfarin.
- 2. (Currently amended) The method of claim 1, wherein the <u>subject is Caucasian and the</u> single nucleotide polymorphism in the VKOR gene is a G→ C alteration at nucleotide 2581 of the nucleotide sequence of SEQ ID NO:11.
- 3. (Original) A method of identifying a human subject having increased sensitivity to warfarin, comprising:
  - a) correlating the presence of a single nucleotide polymorphism in the VKOR gene with increased sensitivity to warfarin; and
  - b) detecting the single nucleotide polymorphism of step (a) in the subject, thereby identifying a subject having increased sensitivity to warfarin.
- 4. (Currently amended) A method of identifying a single nucleotide polymorphism in the VKOR gene correlated with increased sensitivity to warfarin, comprising:
  - a) identifying a <u>human</u> subject having increased sensitivity to warfarin;
  - b) detecting in a population of the subjects of (a) above the presence of a single nucleotide polymorphism in the VKOR gene; and
  - c) correlating the presence of the single nucleotide polymorphism of step (b) with the increased sensitivity to warfarin in the <u>population of subjects</u>, thereby identifying a single nucleotide polymorphism in the VKOR gene correlated with increased sensitivity to

Attorney Docket No. 5470.401 Application Serial No. 10/573,131 Page 3 of 21

warfarin.

- 5. (Currently amended) A method of correlating a single nucleotide polymorphism in the VKOR gene of a <u>human</u> subject with increased sensitivity to warfarin, comprising:
  - a) identifying a subject having increased sensitivity to warfarin;
  - b) determining the nucleotide sequence of the VKOR gene in a population of the subjects of (a);
- c) comparing the nucleotide sequence of step (b) with the wild type nucleotide sequence of the VKOR gene;
  - d) detecting a single nucleotide polymorphism in the nucleotide sequence of (b); and
- e) correlating the single nucleotide polymorphism of (d) with increased sensitivity to warfarin in the subject of (a).

## 6-16. (Canceled).

- 17. (New) A method of screening for a single nucleotide polymorphism in the VKOR gene of a human subject that is associated with increased sensitivity to warfarin, comprising:
  - a) detecting single nucleotide polymorphisms in the VKOR gene of a human subject;
- b) performing a population based study to detect the polymorphisms in a group of human subjects with increased sensitivity to warfarin and ethnically matched controls;
- c) identifying an allele of a single nucleotide polymorphism in the VKOR gene that is associated with increased sensitivity to warfarin.
